1. Data for lifetime excess cancer risk estimates

Overview

The summary data used to calculate lifetime excess cancer risk and the results for chloroform are provided in the tables below. For more detailed information on supporting data and sources, see below for each exposure pathway.

i. Environmental Concentrations

Exposure pathway	Units	Average	Maximum	Notes
Outdoor air	µg/m ³	0.15	2.3	
Indoor air	µg/m ³	2.53	33	
Drinking water	µg/L	31.9	151	
Foods and beverages		See detailed data	Not estimated	

ii. Calculated Lifetime Daily Intake

Exposure pathway	Average intake (mg/kg bodyweight per day)	Maximum intake (mg/kg bodyweight per day)
Outdoor air	0.0000035	0.000053
Indoor air	0.00082	0.011
Drinking water	0.00083	0.0039
Foods and beverages	0.0000047	Not estimated

iii. Cancer Potency Factors

Exposure route	Health Canada	US EPA	CA OEHA
Inhalation	--	0.0805	0.019
Ingestion	--	--	0.031

Sources for Cancer Potency Factors:

- Health Canada, 2010. Federal Contaminated Site Risk Assessment in Canada, Part I: Guidance on Human Health Preliminary Quantitative Risk Assessment. Version 2.0.
- Health Canada, 2010. Federal Contaminated Site Risk Assessment in Canada, Part II: Health Canada Toxicological Reference Values (TRVs) and Chemical-Specific Factors. Version 2.0.
- United States Environmental Protection Agency Integrated Risk Information System
- California Office of Environmental Health Hazard Assessment, 2009. Air Toxics Hot Spots Risk Assessment Guidelines Part II: Technical Support Document for Cancer Potency Factors, Appendix A. (Updated 2011)

iv. Lifetime Excess Cancer Risk (per million people)

Exposure pathway	Average ¹			Maximum ²
	Health Canada	US EPA	CA OEHHA ³	
Outdoor air	--	0.27941	0.066	1.01
Indoor air	--	66.165	15.6	863.02
Drinking water	--	--	25.6	121.55
Foods and beverages	--	--	0.146	Not estimated

¹Lifetime excess cancer risk based on average intake x cancer potency factor from each agency

²Lifetime excess cancer risk based on maximum intake x highest cancer potency factor

³California Office of Environmental Health Hazard Assessment

Supporting data by exposure pathway

i. Outdoor air

Outdoor air concentrations are from the National Air Pollution Surveillance monitoring network operated by Environment Canada, for the year 2010.

Source	Stations (n)	Min	Max	Mean	DF
NAPS 2010 ($\mu\text{g}/\text{m}^3$)	53	0.012	1.2	0.073	1.0

DF = Detection frequency

We assume chloroform is present at these levels in all outdoor air, although concentrations may vary from one location to another.

ii. Indoor air

Indoor air concentrations are based on data published in peer-reviewed literature since 2000. A ranking system was used to select data most representative of Canadian conditions circa 2011:

1. Canadian data collected in 2000 or more recently, sample duration of 24 hours or longer;
2. US studies of similar currency and sample duration;
3. Studies from northern European countries of similar currency and sample duration;
4. Canadian, US or European studies with data collected prior to 2000 and similar sample duration; and
5. Studies with sample duration of less than 24 hours regardless of country or collection date, or studies from countries not comparable to Canada.

iii. Dust

Chloroform is not expected to be present in indoor dust in significant amounts.

iv. Drinking water

Drinking water data are from the Ontario Drinking Water Surveillance Program (DWSP) for 2011. A review of published reports was also conducted in order to compare how well the Ontario data represented other regions in Canada.

Source	Units	DL							
Ontario DWSP 2011	(µg/L)	0.1							
Sample Type	Parameter	Mean	SD	Min	25 th	50 th	75 th	Max	N
Distribution		31.9	27.1	0.5	7.13	26.0	51.2	151.0	342

DL = Detection limit
 SD = Standard Deviation

v. Food and Beverages

Food consumption data are from the Statistics Canada Food Survey (2006)- Food available, adjusted for losses tables, and from the Nutrition Canada Survey (1970-1972).

Food concentration data are primarily from the US-FDA Total Diet Study (2003-2004), with additional data on metals and several PAHs from the Canadian Food Inspection Agency (CFIA) - National Chemical Residue Monitoring Program: 2009-2010 Annual Report and the US-FDA (TDS Statistics on Element Results - 2008).

In order to better represent actual intake, we incorporated data for cooked and/or processed foods, as in some cases, this can either add to or diminish the amount measured in raw food.

Concentration data were obtained for 70% of total meat consumed, 46% of total seafood consumed, 35% of total fruit consumed, 27% of total vegetables consumed, 59% of total dairy and eggs consumed, 1% of total grains consumed, and 52% of total beverages consumed.

2. Data quality for lifetime excess cancer risk estimates

Only publicly available data were used to calculate these indicators. Data that are not publicly available may produce different results.

No systematic method for measuring data quality was possible, so we provide the following assessments of how well the data used may represent the actual Canadian average levels. Quality is rated higher when there are data from a number of Canadian monitors, or from Canadian studies that show results similar to other comparable studies. Quality is rated lower when data from few monitors or studies were available, and lowest when estimates are based on non-Canadian data. Others may rate data quality differently.

Exposure Pathway	Data Quality	Notes
Outdoor air	High	<ul style="list-style-type: none"> Chloroform is regularly measured in outdoor air at 53 monitoring stations across Canada using accepted protocols.
Indoor air	Moderate	<ul style="list-style-type: none"> Good agreement in mean concentrations measured in three recent Canadian studies (Halifax NS, Regina SK, Windsor ON).
Drinking water	Moderate	<ul style="list-style-type: none"> All samples (n=342) from the Ontario Drinking Water Surveillance Program contained chloroform in 2011, and there is reasonable agreement with a national survey of drinking water distribution systems (1994-2000) and a smaller study conducted in ON and NS.
Foods and beverages	Very Low	<ul style="list-style-type: none"> No Canadian data on concentrations of chloroform in foods and beverages were identified. Data from the US-FDA (TDS-2003-2004) were used for this estimate.

3. Data for mapping concentrations

The maps use geographic coordinates at the census block level to represent residential locations. Concentration estimates are mapped at the health region level, which are created with aggregated census block data.

We used a model to predict annual average concentrations of chloroform in outdoor air at residential locations for 2011. These are predicted using levels measured from the National Air Pollution Surveillance (NAPS) monitors and estimated concentrations from known emitters. For more information on how these estimates were created, please see the Mapping Methods document on the [Environmental Approach](#) section of our website.

Estimates by health region

The table below shows predicted chloroform concentrations by province based on data at the health region level. The median concentration of chloroform measured in outdoor air in 2011 at the health region level was 0.085 $\mu\text{g}/\text{m}^3$, while the mean concentration was 0.091 $\mu\text{g}/\text{m}^3$. Concentrations of chloroform can be higher or lower than average in many locations.

i. Provincial averages of predicted chloroform concentrations ($\mu\text{g}/\text{m}^3$) in outdoor air in 2011 based on health regions

Province	Median	Mean
BC	0.091	0.098
AB	0.081	0.082
SK	0.072	0.075
MB	0.083	0.084
ON	0.085	0.090
QC	0.088	0.096
